Simple interest programming c

How to write a C program to calculate the simple interest with the sample code. Before entering the C program to calculate the example of simple interest, we try to understand the mathematical formula to calculate the simple interest: Simple interest = (Principal Amount * Interest rate * Number of years) / 100 C Program for Calculating Simple Interest: The C program allows the user to enter the "main amount", "interest rate", and the "number of years". We will calculate the simple interest using the values inserted with the help of the simple interest formula mentioned above. *Interf(")'s main interest rate(" float princpalAmt, rateOfInterest, Time_Period, simplest,monthlyEmi; printf("Please enter the main value: = "); scanf("%f", &principalAmt); printf("Please enter the interest rate: = "); scanf("%f", > printf(" monthly Emi = (principalAmt+simpleInterest)/(Time_Period*12); printf("Monthly EMI for the use of a simple interest is = %2f", monthlyEmi); Return 0; Exit: Please enter the Main Import: = 730000 Please enter the interest rate: = 8.85 Please enter the time period in years: = 5 simple interest for the main capital 730000.00 is = 323025.00 monthly EMI for the use of simple interest is = 17550.42 Impariamo assimple interest in programming language C. The simple interest is basically a quick and simple calculation of the interest charged on a particular main amount. Before going to write the program c to calculate the simple interest, we understand what is interest?, What are the types of interest?, and what is simple interest? Also, will I show how to calculate the simple interest? and define P, R and T in a simple formula of interest. In addition, I will demonstrate the logic to calculate the simple interest. After all, I will write a logic program and C to Calculate simple interest with output. Content table: What is interest? Interest is the extra money that the borrower pays to use the creditor's money. When a person lends money to a borrower, the borrower usually has to pay an extra amount of money to the creditor. This extra money is what we call interest. In other words, if you deposit money in a bank, interest is the money you earn as a percentage of your deposit. What are the types of interest? There are three types of interest as follows: Simple (regular) Interest Interest Compound Interest What is simple interest? Simple interest (S.I) is the method of calculating the amount of interest for a certain main amount of money. In other words, Simple Interest is the rate at which we lend or lend money. How to calculate the simple interest? Simple interest formula calculated according to the following simple interest formula: Simple Interest = (Principal Amount × Interest Rate × Number/ 100 or SI = (P × R × T)/100 Where,SI is the simple interestP is the T principle amount is the time period for which the money is investedR is the interest rate What is the main amount? It's an initial amount of money. In the context of the loan, the main is the initial size of a loan; may also be the amount still due on a loan. What is the interest rate? The interest rate is the amount of a credit tax for the use of goods expressed as a percentage of the capital. It is the interest rate per year. What do you mean by T in Simple Interest formula? T is the time period for which money is invested or borrowed. Demonstration to calculate a simple interest To calculate the simple interest we will take the help of this formula: You can see it from the following example: Question:Calculate the simple interest if the main amount is Rs. 2000, the time period is 1 year and the rate is 10%. Solution: According to the simple formula we have,S.I. = [(Principal (P) × Time (T) × Rate (r)))] / 100]So, from the above values,S.I. = [(2000 × 1 × 10)] / 100 = 20000/100 =200 So, the simple interest at the end of 1 year will be Rs. 200. The logic to calculate the simple interestStep 1:Input the main amount in some variable princple says. Step 2: Input time in some variable say time. Step 3: input rate in a certain variable direction frequency. Step 4:Introduce simple interest using the SI = formula (principle * rate *) / 100.Step 5:Finally, print the resulting value of the SI.C program to calculate simple interest /*C programme to calculate a simple interest */ #include int main)({ float principal, time, rate, SI; /* Input principle, rate and time */ printf("Enter principal (mount: "); scanf("%f, &principle;) printf("Input time: "); scanf("%f, &time;); printf("Input value: "); scanf("%f, &rate;); /* Calculates the simple interest */ SI = (main time * * * * * rate) / 100; /* Prints the resulting value of SI */ printf("Simple interest = %f," SI; return 0; } The output of the Program with code: When the code above is executed, it produces the following results: Enter the main amount: 12Enter time: 2Enter rate: 3Simple Interest = 0.720000Conclusion: This is it. The C program allows the user to enter the Main Import, Interest Rate and Number of years. Using these values, this C program calculates the simple interest using the following formula: Simple interest = (Principal Amount * Interest rate * Number of years) / 100. c programming for simple interest. c programming simple and compound interest
